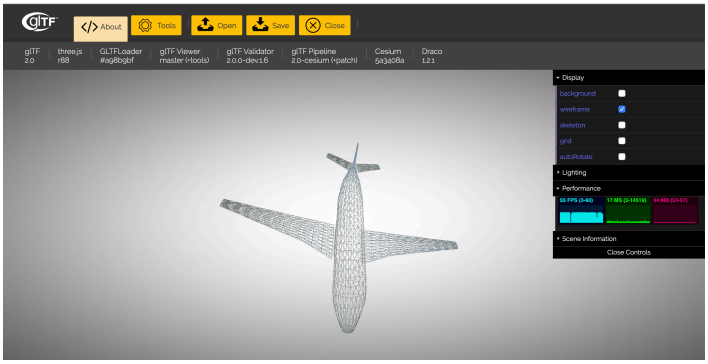
Assignment 10: glTF!

We will load our favorite mesh from a file and then convert it to a valid glTF file. You can choose if you want to do this assignment in JavaScript or in Python. In class, we used Python (see our colab from class `https://cs460.org/shortcuts/33/`).



Starter code for assignment 10. After pulling from upstream, there is the folder `10` in your fork. This folder contains an `index.html` file that uses JavaScript to make glTF JSON. This folder also contains a `gltf.py` script that you can run with `python gltf.py` to output the glTF JSON. As a start for this assignment, both versions create an identical valid glTF JSON structure holding a single triangle (see screenshot above).

Part 1 (1 points): Please decide which language you will use: JavaScript or Python. Python might be a bit easier to load and parse an existing file—with JavaScript we need to use Ajax to load the existing mesh and parse it (or as option 3: use a Three.js loader and grab the vertices/indices from there). For parsing files with Python look here: `https://tutorial.eyehunts.com/python/python-read-file-line-by-line-readlines/` For using Javascript and Ajax look here: `https://developer.mozilla.org/en-US/docs/Web/API/XMLHttpRequest/Using_XMLHttpRequest`.

Part 2 (15 points): Load a mesh from an external file. A .PLY or .OBJ file might be the easiest to parse.

Part 3 (20 points): Parse all vertices from the loaded mesh and create the VERTICES array and base64 code.

Part 4 (20 points): Parse all indices from the loaded mesh and create the INDICES array and base 64 code.

Part 5 (10 points): Calculate all required fields for the glTF file (as we did in class) and generate the glTF JSON code. Store the glTF JSON code in a glTF file.

Part 6 (5 points): Please make sure the glTF file is valid using `http://github.khronos.org/glTF-Validator/`.

Validation is performed locally in your browser. Submitted assets are not uploaded.

```
{
    "uri": "airplane.gltf",
    "mimeType": "model/gltf+json",
    "validatorVersion": "2.0.0-dev.2.7",
    "validatedAt": "2019-12-02T23:02:04.129Z",
    "issues": {
        "numErrors": 0,
        "numWarnings": 0,
        "numInfos": 0,
        "numHints": 0,
        "messages": [],
        "truncated": false
    },
    "info": {
        "version": "2.0",
        "generator": "CS460 Magic Fingers",
        "resources": [
            {
                "pointer": "/buffers/0",
                "mimeType": "application/gltf-
                "storage": "data-uri",
                "byteLength": 16020
            },
            {
                "pointer": "/buffers/1",
                "mimeType": "application/gltf-
                "storage": "data-uri",
                "byteLength": 14712
            }
        ],
        "hasAnimations": false,
        "hasMaterials": false,
        "hasMorphTargets": false,
        "hasSkins": false,
        "hasTextures": false,
        "hasDefaultScene": true,
        "primitivesCount": 1,
        "maxAttributesUsed": 1
    }
}
```

Part 7 (5 points): Visualize the glTF file using `https://gltf.insimo.com/`. You might have to choose the wireframe display option since the glTF file does not include material (Display -> Wireframe, in the dat.GUI). **Please replace the screenshot above.**

Part 8 (5 points): Add the glTF file to your fork.

Part 9 (10 points): Choose a final project—either an existing one from `https://cs460.org/assignments/final/` or a new one. Please list the project here and in the link. If working as a team, assemble your team and list the team members below and in the link.

`Final_Project`
Project: CS410 Intro
Working with Jiehyun Kim (Jenna)

Part 10 (9 points): Make sure this PDF and your glTF file are in your fork on github. Then, please send a pull request.

Bonus (33 points):

Part 1 (15 points): Please add any kind of material to the glTF file. For this, you would have to read the specs or google for examples :)

Part 2 (18 points): Write THREE.js code that displays your glTF file using the `THREE.GLTFLoader`.
